

January 31, 2007

Mr Herman De Croo
President of the Belgian Federal Parliament
To Mr & Mrs the Deputies
Palais de la Nation
1008 BRUSSELS

Registered letter

CALL OF BRUSSELS

Electrosmog and non compliance with article 23 of the Constitution.

Request for questioning of Mr Rudy Demotte, Federal Health Minister of Belgium.

Mr. President,
Ladies and Gentleman

On August 10, 2005, the ministers P. Dewael, A. Flahaut, Mr. Verwilghen, R. Demotte and B. Tobback signed a Royal Decree authorizing to submit each living person in the Kingdom of Belgium every single second of his life, to a radiation in pulsed high frequencies of 20.6 Volt per meter at 900 Mhz (*and even more at higher frequencies*) and consequently to all the officially recognized biological effects associated therewith.

These limit value have been established on fragmentary scientific bases and are being argued against by many scientists, in particular because they do not take into account neither the permanent nature of the exposure, nor quantum physics. Incidentally none of the signatory ministers, nor any volunteer, would dare to submit himself to such a high frequencies intensity over a prolonged period of time and observe the effects on his own health.

Based on the most recent peer reviewed research, the 3 V/m limit value (*and up to 4,3 V/m for UMTS*) envisaged by the proposals of the Deputies of the Brussels Parliament and of the Flemish Parliament is still far too high for an acceptable health protection, since health effects occur on quite lower levels of exposure.

The European Commission legislated to create an electromagnetic standard of compatibility. The electronic instruments which are able to work without damage while being subjected to an electromagnetic field of 3 V/m can receive a "EC" logo. However contrary to these devices, the human body is not shielded to resist 3 V/m without health impact.

By the present call, we ask for the questioning of the Health Minister, Mr Rudy Demotte, in front of the Parliament, in a plenary sitting, for non compliance with Article 23 of the Constitution, which guarantees to every citizen of the Kingdom "*the right for health protection*" and "*the right for a healthy environment*". More fundamentally still, this policy of setting the population in deliberated danger constitutes an infringement of the Human Rights.

We trust that given the extent of the problems hereby covered and today made widely available in the most up-to-date scientific literature, you will as a Member of Parliament honor your high responsibilities and will not satisfy yourself with low scale or dilatory measures.

Please find **attached on pages 7-12** our rationale. We would be pleased to answer any of your questions related to this request.

Yours respectfully,

For the Teslabel Association

Dr Joseph Agie de Selsaten
Avenue Boileau, 12
B-1040 Brussels

Ing. Jean DELCOIGNE
Avenue du Martin-Pêcheur 11
B-1170 Watermael-Boitsfort

Ir Jean-Luc GUILMOT

Appendix to the Letter to the Parliament on Electrosmog

The reality the biological effects due to the exposure to radiation's of pulsed high frequencies is explicitly recognized on the official – but widely non comprehensive – website www.infogsm.be, where it is also mentioned that these effects probably do not have negative health effects. Any honest person would realize that the terms used show that the government is by no means in a position to guarantee that these biological effects are harmless.

Many scientific studies (*published in peer reviewed scientific journals*), and available among others on www.001.be.cx, highlight the harmful effects of high frequencies radiation's on living beings. To date the majority of the *published peer reviewed* epidemiologic studies relating to base stations point towards harmful health effects. To this should be added an impressive number of testimonies from medical doctors, residents close to base stations, radar operators and former users of Wi-Fi transmitters or cordless phones, etc.

The international insurance and re-insurance companies exclude any coverage from medical risks related to the electromagnetic fields (CEM), considering those as "*emerging risks*", this being based upon the same scientific database as the World Health Organization (WHO).

Currently, all the recommendations of standards consider only the CEM as "*an isolated agent*". People however are being exposed to other polluting agents, for which the co-induced effects with EMF radiation's have never been studied. Moreover factors of reduction to obtain the current recommended standards are definitely lower than those applied for other polluting agents.

The large group of people carrying not only pacemakers but also simple metal implants (such as for example screws after bone breakage's) are currently excluded from any protection (Ref. ICNIRP Guidelines - Health Physics April 1998, vol. 74, No 4:494-522 p.2).

A large movement of citizens is mobilizing throughout the world on this issue. Conferences and demonstrations of protest took place in Belgium (and in many other countries) in 2006 and others are scheduled for 2007. Cell phone companies are facing a ever growing opposition on preliminary investigations for the installation of new base stations, especially UMTS and Wi-Max, which are perceived by a large part of the public as particularly harmful.

If the majority of the Belgian medical profession does not yet denounce electrosmog by high frequencies as being at least partly the source of the poor physical and mental health statistics of the Belgian population in 2006, on the other hand more and more physicians abroad are calling for emergency measures. In Germany a recent open letter by a broad consortium of physicians to the attention of the Chancellor strongly denounces the health risks associated with wireless technologies on the basis of studies and clinical observations. In Sweden, Professor Olle Johannson, in a striking published paper, highlighted the significant correlation between the sudden degradation of many health indices in 1997 and the first rise in frequency at 1800 MHz. Other publications show the correlation between the incidence of the malignant melanoma – together with other types of cancers – and electromagnetic pollution, after other possible causes such as the common sunlight exposure have been discarded. In Belgium also it is legitimate to question the worrying trend of many health indices among which increases in headaches, sleep disturbances or unexplained tiredness, a growing number of accidents due to faintness or giddiness, and many other health anomalies. Moreover the absence of epidemiological studies related to base stations or a proper register of cancers should be strongly denounced.

In Belgium Dr. J. Vanderstraeten, member of the High Council of Hygiene, did put forth the assumption in a medical journal that Wi-Max base stations could be harmful (Le Généraliste, 12/12/06). And Prof. A. Vander Vorst, also member of the HCH, clearly put forward the idea that “*DECT cordless phones should be prohibited in private homes*” (Imagine N°58, November 2006).

In order not to reiterate unfortunate dossiers like the one of asbestos or X-rays officially recognized as dangerous by the political community only years after people "from the ground" have had to act as whistleblowers, all the political parties now tend to recognize that is the industry that should prove the harmlessness of those products it wishes to introduce on the market, an not society that should demonstrate that these products are harmful. Needless to say that from theory to practice, there still is a large gap.

The current limit values constitute a high health risk, particularly on the basis of complaints from the military recorded since the forties, of the large scale experiment of the United States embassy in Moscow in the fifties to the seventies, of the TNO study carried out in Holland in 2003, of the results of all the epidemiological studies on mobile phone base stations *published* in peer reviewed journals (hardly *any* of them point towards an *absence* of harmful effects), of very many clinical and biological studies on cell cultures, animals or people, of a general degradation of the health indices and of a growing number of complaints received by associations. All this while the average exposure to high frequencies still hardly exceeds 0.5 V/m.

We consider the following answers from the Health Minister as evasive or dilatory :

1. *I cannot only decide on my own* : even if from an industrial point of view Belgium is part of international telecommunication networks, the country remains sovereign for all what relates to the healthcare of its own people, and the ultimate responsible person is the Health Minister. National public health issues must always take precedence over industrial objectives. When the time of accounts will come, we will not accept a line of defense from Mr. Demotte based on the grounds that Belgium was under the constraint of international requirements or that he was compelled to base Belgium's position on other countries or that he it could not prevent operators from fulfilling their obligations to cover the territory in high frequencies.
2. *In Belgium the standards are twice as low as in other countries (even 4 times if one considers the power density instead of the electric field)*: in the field of toxicology, do you really think that a 50 units limit value protects you better than a 100 units value – a figure that is utterly called into question by part of the scientific community – if the effective toxic limit value is 1 unit? This line of reasoning has nothing to do to do with what is called the principle of precaution.
3. *The current values are still clearly below the Belgian standard, and a fortiori below the limit values recommended by WHO*: based on the only *thermal* effects applied for a *short period of time* onto an *inert* body – dead, without life – the international recommendations are out of scope because of a fundamental conceptual vice. Unfortunately, many people still grant a blind confidence with the official positions and are influenced by those who claim that the current level is so low compared to "severe" standards that no effect whatsoever is possible. Does one try to anaesthetize the minds while letting believe poorly documented people that there is no reason to worry? It would be simply grotesque if there were not so

many people suffering – as evidenced by testimonies from doctors and victims – or likely to suffer from it in the short or medium term.

4. *The zero risk does not exist*: this argument is as inappropriate as unacceptable, particularly when considering the worrying results of the latest scientific publications of these last five years. We consider that this is a line of defense that goes against human dignity and which openly mistakes the most recent scientific projections. Also this argument implies that one puts in the balance a technological progress that would be advantageous to all. However people have not been consulted about the principle of changing our atmosphere into a gigantic carrier of electromagnetic transmission used to exchange videos or data. Even with respect to just cell phone phones, how many users would drastically restrict their use if they were honestly informed about the health consequences, on themselves and on others?
5. *I am awaiting the results of the international studies and new instructions from WHO to adapt the standards, WHO being the only valid reference, and advances being expected in 2007 or 2008 on these issues* : first, we have no reason to believe that major changes can be expected from the WHO in the near future. A open registered letter was addressed in November 2006 to the Head of the EMF project, Dr. Emilie van Deventer, asking her to quote *published* epidemiological studies on cell phone base stations pointing towards the *absence* of health risks: to date this letter has received no answer and this as such is eloquent. Then, several scientists severely criticize the way in which the former Head of the EMF project Mr. Repacholi, now reconverted into an industry consultant, mismanaged the department and the WHO EMF project during these ten last years, on both ethical and scientific grounds. A paper published in of November 2006 by Repacholi and van Deventer in the Environmental Health Perspective journal, available on line, presents a particularly biased view on the current scientific knowledge and completely minimizes the risks involved in exposure to the base stations. Lastly, the argument used in memorandum 304 of the WHO, according to which people would be much more irradiated by the FM radiofrequencies that those of mobile telephony and wireless networks, is vigorously disputed by many scientists.
6. *The "TNO" Dutch study of 2003 could not be replicated by the Swiss study in 2006*: This study is severely criticized by both associations and specialists: its protocol is far away from the original experiment ; lawyer offices in Holland have requested complementary information on crude data ; at best it fosters doubt but in no case does it cancel the 2003 results; and mots of all in any case, we are still talking here about short term exposures ($\frac{3}{4}$ of an hour) and not chronic exposures 24 hours a day.

To conclude

It is imperative to **question a simplistic approach** which denies the facts when these facts cannot be entirely explained by current theories or scientific models. What the public opinion knows about electromagnetic radiation's is only an official opinion, doctrines that a great number of doctors and qualified scientists do not dare to criticize by opposing to it the sovereign testimony of facts.

The capture of the medical expertise by industrial lobbies is too often obvious. Each one among us must absolutely become aware of the enormous collusion between research and the commercial economy in this field.

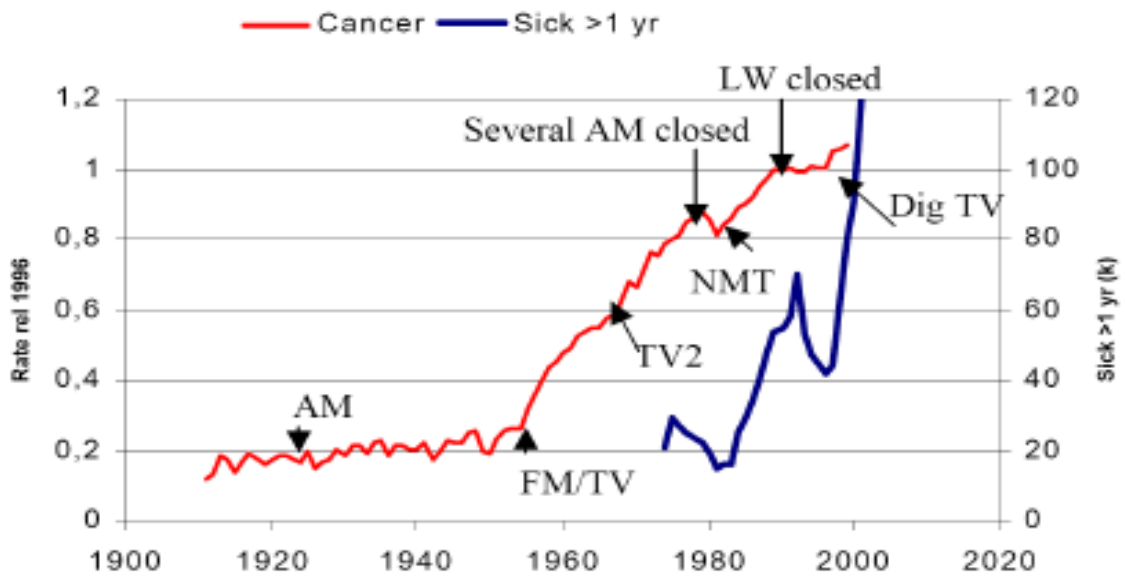

The World Health Organization is described in a series of articles published in *British Medical Newspaper* and *The Lancet* as a corrupted and out of breath institution. It is the "next UNESCO" writes in particular *The Lancet*. (La Recherche, Oct.. 1995, 280; p.15)

"It is not acceptable that laboratories deny the established facts...., that justice is completely unsuited and cannot protect the citizen, while it is its very mission, because it applies to a product or a technology the principle which should be reserved to people: "*no culpability declared without absolute certainty*" and that it forces to prove that industry voluntarily hid information, when it should be to industry to prove the non-toxicity of its products... In any case, doubt should not be used as a cover and consumers should be warned when this doubt exists "(Dr. B Donatini).

In the files such as contaminated blood, growth hormone, cloud of Chernobyl "*stopped at the border*", asbestos and its cancers, foot and mouth disease, dioxin in milk and meats... in all these subjects, journalists abundantly emphasized **the vulnerability of the medical administration vis-a-vis industry and medical corporatism**. Things are all the more embarrassing as each one of these dossiers has been made available to the public by journalists or associations, and not by the authorities.

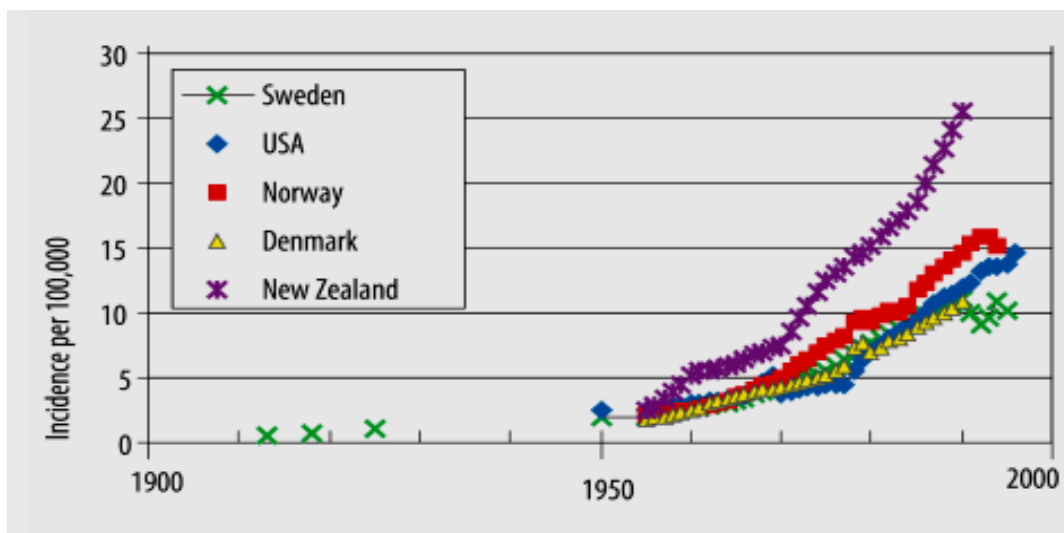

"We wish to focus the attention of the reader on the use of scientific experts to delay decisions of general interest" (in: "*Qui décide pour notre Santé ?*" (Who decides for our health), B.Cassou, M.Schiff.)

- 1906: France, the departmental inspector of work in Caen, Denis Auribault, underlines the extend of the damages in the asbestos factories. Document published in 1906 in the Bulletin of the Work Inspection.
- 1918: Asbestos is considered so dangerous that a statistician doctor advises the insurance company *Prudential Insurance Company* continuing to stop covering workmen who work in asbestos factories.
- 1931: Great Britain, first regulation on the dangers of asbestos.
- 1996: France, prohibition of the use of asbestos. The same year, the Academy of Medicine did again vote unanimously a report minimizing the risks of pollution from fibers of asbestos.

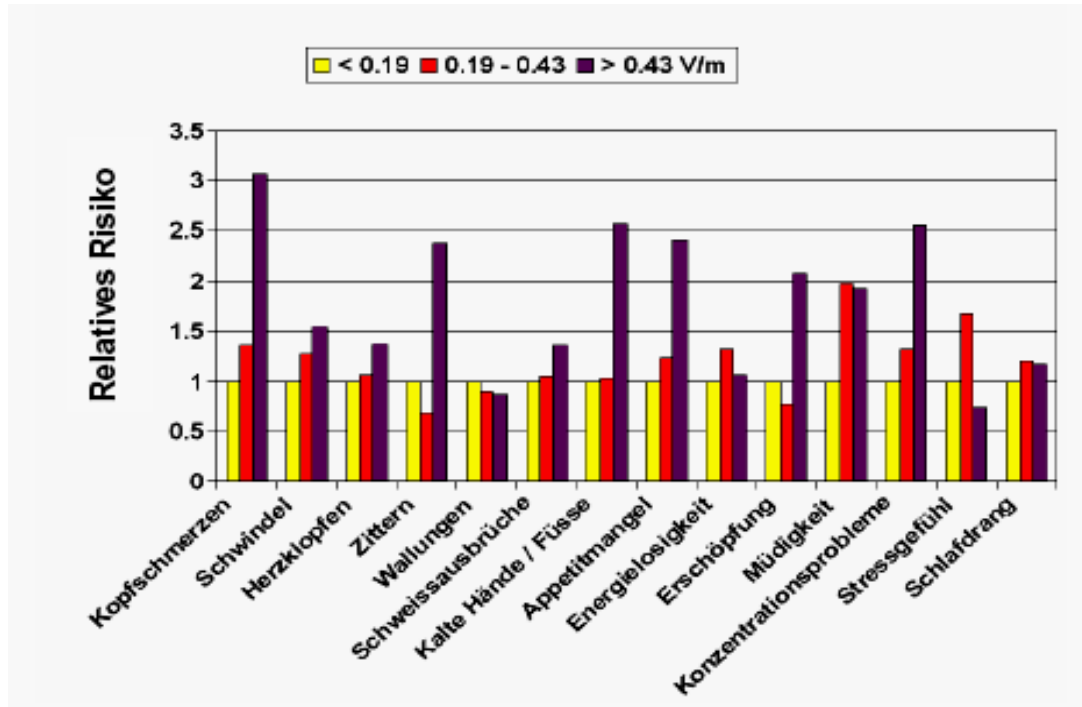

Trends of cancer and chronic diseases in Sweden as related to electromagnetic fields

Hallberg Ö, Johansson O, "Cancerdödlighet och långtidssjukskrivning" ("Cancer mortality and longterm sick leave"; in Swedish), Tidskriften Medikament 2002; 7: 4041. Extrait en anglais.

Incidence of malignant melanoma is increasing in several countries

Hallberg Ö, Johansson O, "Malignant melanoma of the skin not a sunshine story!", Med Sci Monit 2004; 10: CR336340.

Evaluation of relative risks of primary subjective symptoms linked to microwaves from base stations for three exposition groups in the sleeping room, based on the least exposed group (yellow).

Hutter, Kundi et al., *Occup Environ Med.* 2006 May;63(5):307-13. Subjective symptoms, sleeping problems, and cognitive performance in subjects living near mobile phone base stations.
