## A scientist brought to silence

### **Mobile Telephony: Dr. Wolfram Haas is sure that electrosmog makes sick**

- the problem is the proof by official medicine.

KIRSCHHAUSEN. Dr. Wolfram Haas was a internist before he moved approximately seven years ago to quantum and information medicine, which studies the energy disturbance of the cell. Monday evening the doctor made a talk within the framework of a conference "Mobile Telephony and Risks" held in Kirschhausen, Germany. (cf ECHO of yesterday).

Every sick cell, explained the doctor, has an energy deficit. That leads to an energy deficit of the organ and eventually of the whole organism. The duty of information medicine would be to help the cell find its natural quantity of energy.

However the performance of the whole organism would only be guaranteed when the natural bio-electro-magnetic necessary phenomena are not disturbed. And it would precisely be the reason why more and more people become sick when faced to electrosmog. When the intercellular communication would be disturbed by external influences such as for example phone masts, the flow of energy would also be disturbed.

Contrary to information medicine, official medicine would only get involved at the end of the process of development of a disease, therefore at the end of the causal chain. For example Dr. Hass quoted the case of a heart stroke which was initiated by arteriosclerosis. Action is only taken when "the child already fell into the well".

Information medicine on the other hand would be positioned at the first causal chain link of a disease. Would the transmission of signals function naturally again, then the cell and therefore the organism could become healthy again. A biological system with such a level of sensitivity as what lies into a cell, can easily be disturbed by external artificial electromagnetic fields. On a purely qualitative basis there is no difference, it is essentially the intensity that matters. The internist speaks about an extremely complex field: "I have just scratched the surface."

**The perfidious aspect of diseases which would be caused by electrosmog would be that they come up insidiously. If one got immediately sick upon using a mobile phone for a few minutes, many more people would react to these dangers and take a critical look at this modern technology.**

Dr. Haas severely criticized that one would try to bring to silence those scientists who have made studies on threats of electrosmog. For example in the past some professors would have lost their chairs or institutes would be been burnt – like in 1996 in Heidelberg.

Alarming indications could be extracted from the latest studies. But no pediatrician would have such a study to be released, in which one would point out the links between electrosmog and

diseases. And this is not "just" about simple sleep disorders or ADS, but also about serious diseases such as leukaemia.

Besides Dr. Haas talked based on his own experience, as he reported to his audience during the conference. He himself became electro-sensitive with symptoms such as the most severe heartbeat rate disorders.

Specialists could not determine the cause. In the end he noted that the symptoms always appeared only at night, and along with time a tinnitus symptom also appeared.

A phone call with professor Wilhelm of the hospital of cranial diseases in Frankfurt would have been the beginning of the solution of all problems. Professor Wilhelm would have drawn his attention to electrosmog. Dr. Haas immediately got rid of his mobile phone - and already after half a year he was feeling much better.

**The information doctor pointed towards an experiment of the University Hospital of Milan: During two minutes during a surgery a mobile phone was held close to the open ear of a patient and it was found that the auditive nerve was submerged. Measurements would have shown that it would have lasted eight minutes until the speed of the nerve impulse would have standardized again.**

Scientists of London came to comparable results, while examining what occurs with the electroencephalogram during a two minutes call with a mobile phone. The "brain electric curve" (*nerve impulse*) would have been highly pathological after the phone call and it would have lasted up to seven days for some people tested until it came back to a standard value. Dr. Haas expressed : "For me this was quite an argument ".

Thereafter he saw in his own cabinet clinical signs of diseases among patients whom he readily could classify (*differential diagnosis*). He would have undertaken measurements in residential and work places areas and many causes could have been cured.

"We consider there is no doubt that electrosmog makes sick" assured Dr Haas. The problem is to prove it according to official medicine, as each person reacts differently to external influences.

Concerning the installation of phone masts [NFT : close to living places], Dr. Hass has a clear opinion: "These installations must be removed until their innocuity is demonstrated.
